

Case Study: 251 Southwark Bridge: Marble Maintenance

Bringing the wow factor back to a marble floor in a managed block of flats

Stone Type: Marble

Room: Ground floor communal entrances, hallways, receptions and lifts

Service: Diamond grind and resurface marble floor tiles to remove surface scratches and etch marks. Deep clean tiles and grout lines. Re-polish to 800 grit mid-shine and apply 4 coats of impregnating sealant.

With over 230SqM of Italian marble throughout the communal areas of this luxury block of flats, it was clear from very early on that a specialist maintenance program would need to be in place to ensure that the stone retained its beauty.

We advised a full deep clean and re-polish, to remove etch marks and bring the stone back to a mid-shine that would really show off the intricacies throughout.

With over 300 flats within the block and only one main entrance, we managed the logistics with the support of the concierge team, to work on the project across 5 nights in order to cause minimal disruption to residents.

Both the management company and tenants were pleased with the results and a maintenance plan has been created to ensure that the stone keeps its wow factor.
